The **SDK Setting** record type allows overriding the standard logic for

- displaying custom price tags;
- displaying an info icon with a custom HTML template;
- selecting additional fields to fill on **Order**, **Order Line Item**, **Delivery Line Item**, and **Delivery** objects, depending on the setting type.

Object record type API name: **SDKSetting**.

Field label	API name	Type	Description
Order Type	`orders__OrderType__c`	Picklist	The order type for which the settings are configured. • Order • Return • Pre-sale If not set, the setting will be applied for all order types of the selected Sales Org.
Sales Organization	`orders__SalesOrganizationId__c`	Lookup (Sales Organization)	Specifies the business unit for which settings are configured. • If set, the setting will be applied for a particular Sales Organization. • If left blank, the setting can be applied to all Sales Organizations.
SDK type	`orders__SDKType__c`	Picklist	A picklist to select where to apply the setting: • `updateDataOnAfterOrderLineItemUpsert` – to set additional fields to fill in on the **objects**. • `getOrderLineItemPriceTag` – to override the standard logic and display the custom price tags defined in the HTML file that is requested by the Apex class from the `orders__Implementation__c` field. • To display an info icon containing an embedded HTML template choose among these settings:
Platform	`orders__Platform__c`	Picklist	Defies the platform where an SDK Setting will be implemented: • CT Mobile Currently not available on this platform. • Salesforce
Version	`orders__Version__c`	Text(255)	The field is used to select the version of the SDK. Currently, the **v1** value should be set to apply the setting. Otherwise, the custom logic will not work.
Implementation	`orders__Implementation__c`	Text(255)	The API name of the Apex class for displaying custom price tags or filling in additional fields on the objects depending on the value in the `orders__SDKType__c` field. It is recommended to name the Apex class based on its function: e.g.: `OrderImplementation.SetUnitPriceAsListPrice`

| Parameters | orders__Parameters__c | Long Text Area(32768) | A list of additional fields written in the JSON format, which will be displayed to fill in when the `updateDataOnAfterOrderLineItemUpsert` SDK Type is selected. |
| Icon | orders__IconImageName__c | Text(255) | The name of the displayed info icon, picked among the listed. |
